Practical Task

1 :- Create React Project

2 :- Create a three pages (Must handle with routing library)

      Home

      About

      Head & Tail

3:- In Home page there should be two links for About page and Head & Tail page

4:- In About page there will be simple paragraph

5:- In Head & Tail page you need to add one dropdown & one submit button.

      - Here you need to implement a logic for head & tail.

      - First of all you need to add is two values in dropdown ' H ' & ' T ' and by default there will be text Select Value as placeholder (if you haven't selected anything).

      - Select any value from dropdown (H or T) and click on submit button that suppose you choose H value and it should be visible below submit button. And now if you add two more times H then that 2 H chars should be visible below first H (Below is the example)

      H ← first added H

      H ← second added H

      H ← third added H

      - Now If you select T then It should be visible beside First H, and if you again add T then it should be visible below first T (Below is example)

      H T

      H T

      H

      - Now if you add H then it should be visible beside first T, and If you again add T then It should visible beside H (Below is the example)

      H T H T

      H T

      H

      - now at last if you add T then we'll add that T below first T

      H T H T

      H T   T

      H

All you need to do is make separate columns for H and T, if you add same char then it will visible below from that added char, if you add new then we'll create new column.

6:- Put a validation in submit button , if you have not selected H or T then there should one validation message like "Please select value from dropdown".

7:- Once you select any value from dropdown and click on submit button, the dropdown should reset to default value (which is "select value").
